

Francesco Cecconi is Professor of Developmental Biology at the Department of Biology - Tor Vergata University, Rome (Italy), and Group leader at the Danish Cancer Society Research Center in Copenhagen, Denmark. He is a renown cell biologist, and his group has been working to unveil the fine molecular mechanisms governing autophagy in cancer ontogenesis and progression, exploiting them for the development of new strategies for cancer therapy. His studies focus on the cross-talk among autophagy, cell division, cell death and the ubiquitin-proteasome system.
